# Used Cars Price Prediction

By: Matthew Leiser, Samantha Lemley, Ryoichi Nakayama, and Shahla Ahmed

# **Topic and Reason**

- The automotive industry has faced a shortage in the Semiconductor Integrate Chips globally
- Semicoductor IC is a critical component for controlling several electronic devices in the vehicle
- Car sales industry is making up for the shortage by raising their APR and prices
- Increasing demand of used cars which is making the prices of used cars higher as well
- Limit our studies and findings for US market only

## **Data Sources**

- https://www.kaggle.com/code/maciejautuch/car-price-prediction/data
- dataset collected in Kaggle
- Different manufacturers and years
- Price as our target variable and rest will pass as features

# **Questions to Answer**

- 1. How does the mileage affect the price of the used car?
- 2. How does the age of the car, condition and fuel type affect the price of the car?
- 3. Will this affect the overall demand for a used car in place of a new car for consumers?

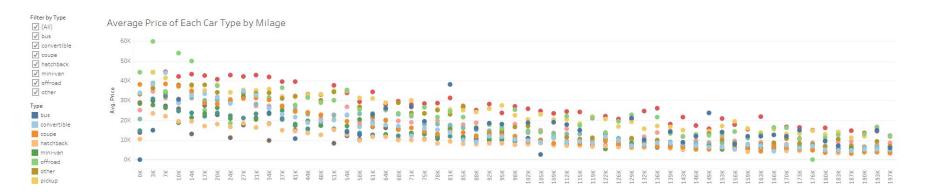

# **Data Analysis & Exploration**

- Creating box plots, subplots and graphs
- Diesel was significantly more than other fuels
- Tableau to get a better understanding of the prices and regions

## What we used

- Decision Tree Regressor
- Linear Regression Model
- Data Cleaning: that includes getting rid of all undesired columns
- Creating table in SQL
- Utilize Tableau
- Machine Learning Model: this includes choosing X variable as a collection of features and Y as a target variable which will be
  Price
- Model for Regression

## **Dashboard**

https://public.tableau.com/app/profile/matt.leiser/viz/CarPricesDashboard\_1668054 0059890/Dashboard1?publish=yes

# **Breakdown of Types**

Breakdown of Vehicle Types

Type

#### Breakdown of Transmission Types

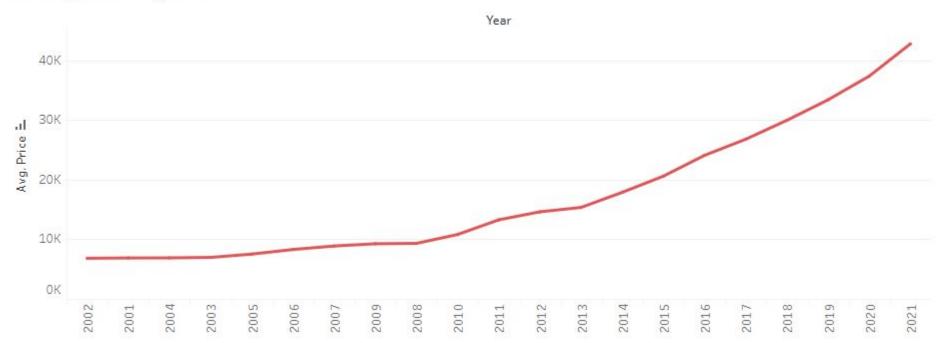

#### Average Price by Fuel

# **Average Price by Year**

Average Price by Year

## **Condition vs. Price**

Condition vs. Price
